CURRICULUM VITAE // 13+ YEARS

Resume & Track Record

Architect and operate high-scale data systems where every layer — ingestion, modeling, serving, operations — matters. Seeking Staff Engineer, Principal Engineer, or Founding Engineer roles in data infrastructure or platform systems. Open to Indian, international, remote, and hybrid opportunities.

⊖Engineering Track Record

2010 — 2026

Senior Software Developer - Team Lead

2020 — 2021

ConvertCart•Real-time data pipelines, production incidents, recommendation engine

MySQLDebeziumPub/SubWebhooksDatastreamGKE

- •
Diagnosed fragile cron-sync system (normalize-on-ingest locked all retroactive changes to full resyncs), redesigned to raw-source storage eliminating expensive resync friction.
- •
Replaced batch sync with real-time pipelines: native webhooks for Shopify and BigCommerce, custom implementations for WooCommerce and Magento 2 (no native webhook support).
- •
Stopped production crisis: **50M-row CDC snapshot consumed 60% CPU, blocked writes**. Diagnosed root cause (table-level snapshots at scale), recovered safely via Datastream, fixed via incremental table-level migration with production-scale testing.
- •
Initiated recommendation engine (Manual → Automated → Smart trust ladder). Validated **80%+ adoption on Smart tier**.

Senior Product Development Lead

2021 — 2026

ConvertCart•Data platform architecture, identity resolution, segmentation, recommendations
MySQLDebeziumPub/SubMongoDBBigQueryClickHouseRedisGKE

- •
Owned architecture, migration, monitoring, and production operation for customer and order data across **200+ merchants on five commerce platforms**.
- •
Designed multi-source BigQuery customer schema consolidating Shopify, BigCommerce, WooCommerce, Magento plus click-tracking. Implemented **deterministic identity resolution** across anonymous sessions and known customers.
- •
Built SQL query builder and materialization pipeline enabling non-technical CSMs to create segments. Reached **1,000+ active segments in 6 months**, eliminated 40-request engineering backlog.
- •
Scaled recommendation engine to **80% merchant adoption** at **200ms p99** across five regions.
- •
Migrated segmentation compute from BigQuery to ClickHouse: **\$2,470 → \$850/month (66% reduction)** via cityHash64-based batched hashing and ClickHouse tuning.
- •
Architected **50+ microservices** platform while growing team from **4 to 7 engineers**.

Backend Consultant

2019 — 2020

Independent Consultant•Freelance backend development

- •
Freelance backend development and delivery work for clients during transition between full-time roles.

Software Development Lead

2018 — 2019

Friday Media Group•Marketplace APIs, content ingestion, team leadership

- •
Managed 3–6 engineers across marketplace API development, content ingestion, and data pipeline systems. Coached team on technical depth and ownership.

Senior Software Engineer

2014 — 2018

Scientific Games•Query optimization, reporting integrations, microservices
MySQLJasperReportsSQL optimization

- •
Diagnosed and fixed pagination + join cardinality inversion bug in recurring reporting query. Fixed by reordering operations (filter before join): **3+ min → <500ms (360x)**.
- •
Built reporting integrations and web services for high-volume gaming platforms.

Web Developer

2012 — 2014

Tenlegs•Email systems, web applications
PHPMySQLHTML/CSS

- •
Designed and built CSS-to-inline email template converter, parsing client website CSS and converting all styling to inline rules for cross-email-client consistency. Adopted internally and considered technically challenging at the time.
- •
Built web applications for an education-sector startup platform serving the artistic community.

Junior Software Engineer

2010 — 2012

ISPG Technologies•LAMP-stack web projects

PHPMySQLLAMP

- •
Delivered multiple web projects end-to-end using PHP, MySQL, HTML, and JavaScript — content management systems, social-networking platforms.
- •
Built strong foundation across the LAMP stack through varied small-to-medium projects.
